

HOW TO PREPARE FOR MDCT CORONAROGRAPHY

Before the examination:

- It is necessary to check the parameters of renal function: urea and creatinine (the results should not be older than a month) and bring them with you. If you do not have these results, the analysis could be done at the Pulse Cardiology Center and the results are ready in 15min (the price is 3000rsd).
- Do not eat, drink and take caffeinated beverages e.g. coffee, tea, Coca-Cola, 4 hours before examination.
- If you know that you have an allergy to iodine contrast agents or medications, it is necessary to inform the medical staff.
- If you are taking Viagra, Cialis or Levitra it is necessary to stop taking the medicine 72 hours before the examination.
- In consultation with your internist or endocrinologist, diabetes drugs such as Gluformin, Metformin, Tefor, Glucophage should be stopped 1 day before the examination, on the day of examination and 1 day after examination (3 day in total). Cardiac and other therapy should be taken as prescribed by the doctor.
- Tell your doctor if you are breastfeeding or pregnant or suspect that you are pregnant, as this recording can have a detrimental effect on the fetus.
- It is necessary to bring all previous medical records and reports from previous coronarography (if you have done them).

RECOVERY AFTER MDCT CORONAROGRAPHY

After the examination is finished you can return to your normal daily activities.
